Can we observe the process of aging in young, healthy humans?

The Pace of Aging

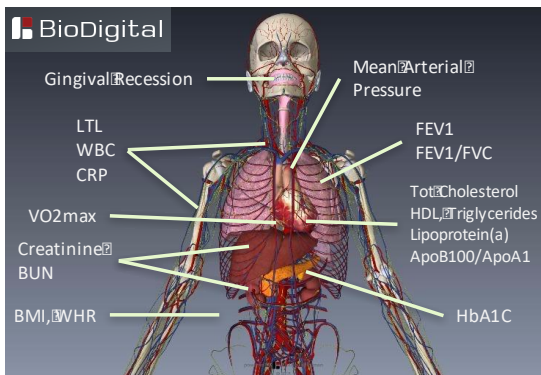

Aging is characterized by a gradual and progressive decline in system integrity

The rate of aging can be inferred from the rate of decline in integrity across multiple organ systems

The Pace of Aging

1

Measure 18 organ-system-integrity indicators at 3 time points

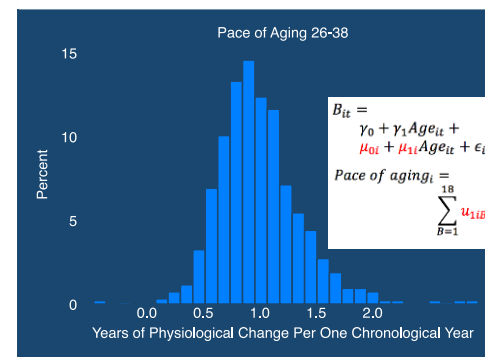

2

Model change over time: Do young, healthy bodies show signs of aging?

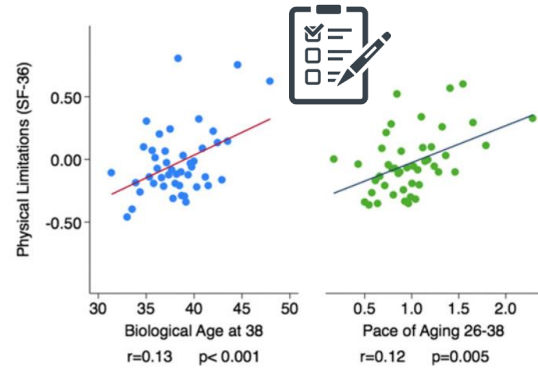

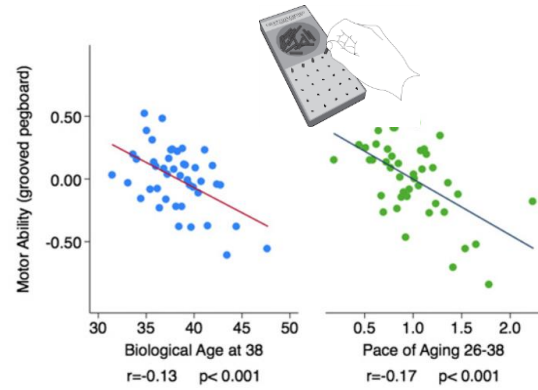

3

Build composite of slopes of change across 18 indicators: "The Pace of Aging"

Faster Pace of Aging associated with poor physical function, cognitive decline, facial aging

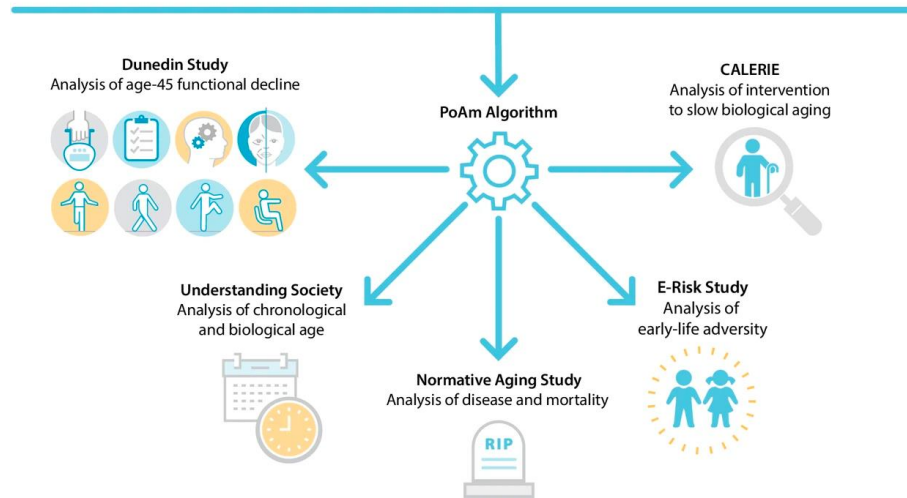

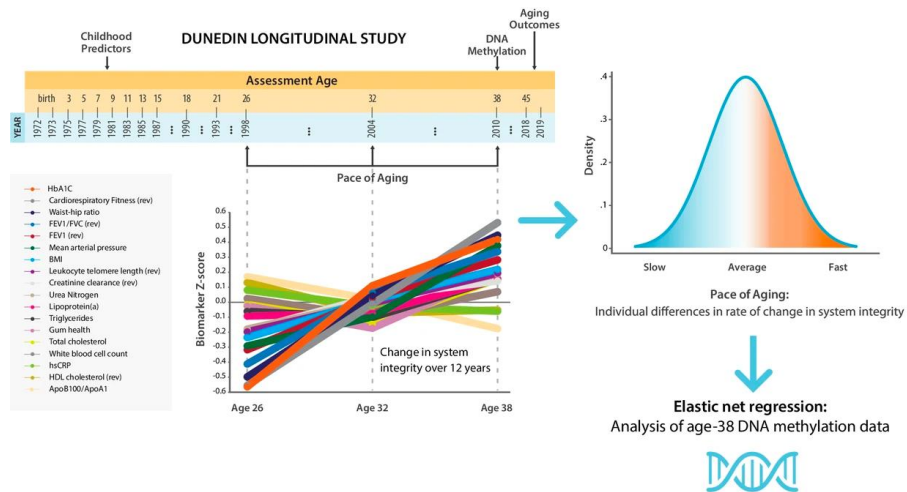

Early-life risks predict accelerated Pace of Aging

Quantification of the pace of biological aging in humans through a blood test, the DunedinPoAm DNA methylation algorithm

Normative
Aging
Study

Faster DunedinPoAm predicts deficits in function at age 45 years

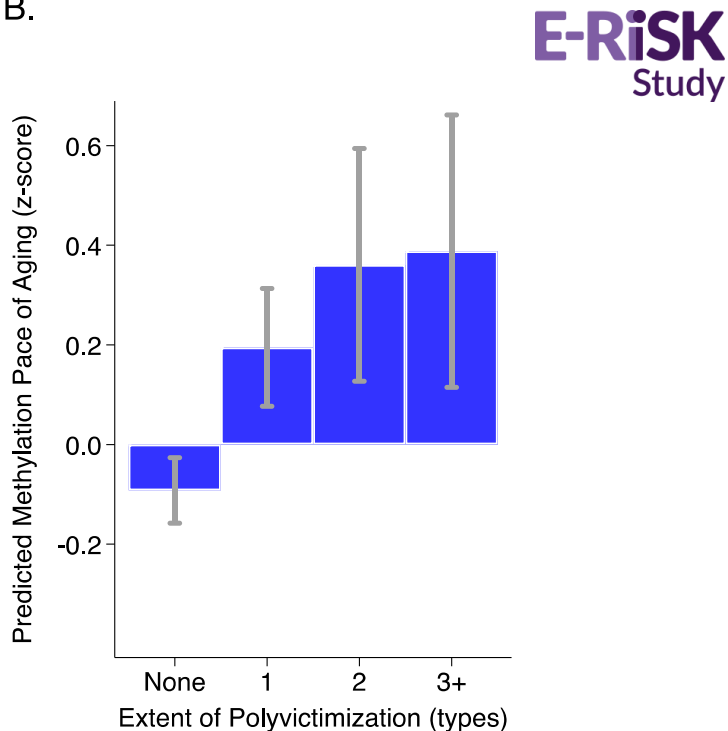

DunedinPoAm is accelerated in young adults exposed to early-life adversity

A.

B.

E-RiSK
Study

DunedinPoAm is accelerated in children and adolescents exposed to early-life adversity

Texas Twin Project
Saliva-DNAM analysis

[Raffington et al. 2020 BioRxiv](#)

Implications & Opportunities

- Processes of aging that compromise function and drive disability are ongoing from early in life
 - Prevention and intervention should begin early
- Molecular measures of the pace of aging make it possible to observe aging processes in real time
 - Etiology
 - Evaluation of intervention effectiveness
 - Surveillance to monitor population trend

Code to implement DunedinPoAm in Illumina 450k or EPIC array data at <https://github.com/danbelsky/DunedinPoAm38>

Thank you!
